

**ELECTRONIC TRANSACTION SYSTEM USING A PORTABLE
PERSONAL DEVICE**

Abstract of the Disclosure

A transaction system is used to make
electronic transactions between an installed network
and portable personal devices. The transaction system
5 loads random information into the personal portable
devices received from the network, so that these random
messages can be read or listened to by a user of the
personal portable device. The random information may
be of any type and does not have to be related to a
10 pre-determined protocol for supporting the electronic
transactions. Random information may be transferred
from the network to the portable personal devices using
at least one terminal that is also used for performing
the electronic transactions.
